To the lengths of rafters above given, must be added the desired projection for cornice. Add also to make stock lengths.

For length of rafter on one-way roofs, take the rafter given for double the width, thus: The rafter for a one-way roof on a building 10 feet wide, 4th pitch, is that given for 20 feet wide, or 11 feet 2 inches.

In area of gable above given no allowance is made for waste or laps.

To verify above or obtain length of rafters for buildings of other widths than above given, multiply the width of building by .559 for 4th pitch; by .6 for 3d pitch and by .71 for half pitch.

## Round Tanks.

How large a bin shall I build to hold 800 bushels? is a very common question. To answer this and similar ones instantly is the object of above table, thus: How long a bin 8 feet wide and 8 feet high is required to hold 800 bushels of oats? Run down the 8-foot column until 823, the nearest amount to 800 bushels, is reached, and opposite, in the center column headed length, is 16, the length required.

For ear corn divide above quantities by 2; i. e., a bin 8x8x16 will hold only 411 bushels ear corn.

For bins 10 feet high add ¼ to above.

 $10 \times 12$ ,  $6 \times 20.5 \times 24$ , or  $4 \times 30$ 

For  $18 \times 20 \times 3$ For  $12 \times 30 \times 3$ For  $20 \times 24 \times 4$

Above are results of full size columns tested at the United States arsenal at Watertown, Mass., by James H. Stanwod, who is instructor in civil engineering at Massachusett: Institute of Technology, as quoted by Frank E. Kidder in his "Architect's Pocket-Book." Above table is based on the following formula:

Safe load per square inch of cross section =  $1000 - (10 \times \frac{\text{length in inches}}{\text{breadth in inches}})$ 

Other woods gave the following, to-wit: Short leaf yellow pine:

Safe load per square inch of cross section =  $850 - (8.5 \times \frac{\text{length in inches}}{3.5 \times 10^{-3}})$ breadth in inches

Oak and Norway pine:

Safe load per square inch of cross section  $-750 - (7.5 \times \frac{\text{length in inches}}{\text{breadth in inches}})$ 

White pine and spruce:

Safe load per square inch of cross section =  $625 - (6 \times \frac{\text{length in inches}}{\text{breadth in inches}}$ 

For the breadth use shortest side, i. e., in a 4x6 the breadth is 4 inches. The results from above equations multiplied by area of cross section give the safe load in pounds.

#### Holding Power of Nails.

In 1892 and 1893 thorough tests of the comparative noiding power of cut and wire nails were made at the United States arsenal, Watertown, Mass. Equal lengths and weights of each kind of nails were driven into spruce to equal depths. In every test the cut nails were greatly superior, the finishing nails showing a superiority of 72.22 per cent and the common nails 47.51 per cent, or an average of 60% per cent in 1200 of the cut nails. But the best nail is a wire nail coated with asphaltum cement, a patented article made by J. C. Pearson Co., or Boston. Being lighter, it is claimed to be the most economical in use.

#### Pounds Required to Pull Nails Out of Pine,

The United States arsenal at Watertown, Mass., made tests of the comparative adhesive power of smooth and cement coated nails driven into common pine, with the following results:

GNACE UND AT HEAD	Length		H WIRE		COATED NAIL
SIZE OF NAIL	driven, inches	Diam- eter, inch	Pounds required to pull	Diam- eter, inch	Pounds required to pull

Explanation—Moving the decimal point one place to the right multiplies by 10, two places by 100, and three places by 1000. Use above table by applying this principle thus: for the feet b.m. in 40 (10  $\times$  4) places 6 ft. 6in. read for four places, considering the decimal point one place to the right, making 48.75 feet; for 400 (100  $\times$  4) places 487.5 feet, and for 4000 (1000  $\times$  4)

pieces, 4875 feet. Again for 43 pieces, 6 ft. 6 in., read for 4 pieces, considering the point one place to right, or 48.75, and then add for the three pieces the contents given for three, or 3.656, or a total of 52 406 feet in 43 pieces, which in final results would be called 52 feet. Thus used these hardwood flooring tables will apply to any quantities.

 $1 \times 2\frac{3}{4}$ , Hardwood Flooring,  $2\frac{3}{4}$ -inch count (2-inch face)

Explanation—Moving the decimal point one place to the right multiplies by 10, two places by 100, and three places by 1000. Use above table by applying this principle, thus: for the feet b m. in 40  $(10\times4)$  places 6 ft. 6 in read for four places, considering the decimal point one place to the right, making 59.58 feet; for 400  $(100\times4)$  pieces 595.8 feet, and for 4000  $(1000\times4)$

pieces, 5959 feet. Again for 43 pieces 6 ft. 6 in. read for 4 pieces, considering the point one place to right, or 59.53, and then add for the three pieces the contents given for three, or 4.499, or a total of 64.049 feet in 43 pieces, which in final results would be called 64 feet. Thus used these hardwood flooring tables will apply to any quantities.

Explanation—Moving the decimal point one place to the right multiplies by 10, two places by 100, and three places by 1000. Use above table by applying this principle, thus: for the feet b. m. in 40 (10×4) pleces 6 ft. 6 in read for four pieces, considering the decimal point one place to the right, making 65 feet; for 400 (100×4) pieces 650 feet, and for 4000 (1000×4)

#### Hardwood Flooring.

pleces 6500 feet. Again for 43 pieces 6 ft. 6 in. read for 4 pieces, considering the point one place to right, or 65., and then add for the three pieces the contents given for three, or 4.875, or a total of 69.875 feet in 43 pieces, which in final results would be called 70 feet. Thus used these hardwood flooring tables will apply to any quantities.

25 58.333 62.500 66.667 Explanation—Moving the decimal point one place to the right multiplies by 10, two places by 100, and three places by 1,000. Use above table by applying this principle, thus: for the feet b. m. in 40 (10  $\times$  4) places 6 ft. 6 in read for four places, considering the decimal point one place to the right, making 86.67 feet; for 400 (100  $\times$  4) pieces 866.7 feet, and for 4000 (1000  $\times$  4)

pieces, 8667 feet. Again for 43 pieces 6 ft. 6 in. read for 4 pieces, considering the point one placetoright, or 86.67, and then add for the three pieces the contents given for three, or 6.5, or a total of 93.17 feet in 43 pieces, which in final results would be called 93 feet. Thus used these hardwood flooring tables will apply to any quantities.

### 15.5833 15.9375 16.2917 16.6458 17 17.0000 17.3542 17.7083 18.0625 Explanation.

Multiply the "Feet B. M. to Lineal Foot" by the total lineal feet, thus: 12 pieces  $11\frac{3}{3}x14\frac{1}{2}$ ,  $8^{\circ}6^{\circ\prime}=102$  lineal feet. 20 pieces  $11\frac{3}{3}x14\frac{1}{2}$ ,  $4^{\circ}3^{\circ\prime}=85$  lineal feet. 2 pieces  $11\frac{3}{3}x14\frac{1}{2}$ ,  $4^{\circ}6^{\circ\prime}=13$  lineal feet.

The table shows this size to run 14,1979 feet B. M. to the lineal foot;  $200 \times 14.1979 = 2839.58$  feet B. M. in the 200 lineal feet of  $11\frac{3}{4}x14\frac{1}{2}$ .

For 1½, 2, and 3 inches thick, multiply the amount of inch pieces of same length by 1½, 2, and 3 respectively.

(342)

## THE MARK BUT IN LAT WAR To Find Quantities of Lumber Required.

LATER OVER BY A.J.

STUDDING on 16 inch centers. Estimate one to the lineal foot: This allows for doubling at openings and at corners.

JOISTS AND RAFTERS on 16 inch centers. To %4 of the length of the building, add 1; thus: For a building 16x32, 34 of 32 = 24, to which add 1, or 25, being the joists required, or the rafters for 1 side. Add 1 or 2 for each bearing partition.

ROOF SHEATHING LAID SOLID. To full area of roof add 10 per cent for waste. If laid 2 inches apart ¾ of above will be required.

68.8 CTR OF B 82.05 ARTICLE 80.85 CT. 1 CO. 1	€ 0 € 0 € 0	Count Width	Face Width	Loss in Matching	To area to be covered add

CORNICES. Multiply the total lineal feet by the combined width of planceer, frieze, and fascia, thus: If the planceer is 12 inches, the frieze 8 inches, and the fascia 4 inches, the combined width is 24 inches or 2 feet b. m. to the lineal foot of cornice.

CORNER BOARDS AND OUTSIDE BASE. as cornices and then add 1/4 if of 11/4, or 1/2 if of 11/2 stuff.

BRIDGING. Multiply the total lineal feet, measuring each string in a straight line, by the following:

	For	2x6, 2x8	or 2x10	on 16	inch	center	s by 2	
	44	2x12	N-02	16	1895	A 66	2	1/4

	161	2x6 and	2x8	12	I THY	- 144	2	-
	- 66	2x10 and	2x12	12	1	66	2	1/4
	66	2x14	-175	12	1.000	66	2	22

134 wide, multiply the area by 12 for the lineal feet required. LATTICE.

4- 5

#### Lath.

Lath when laid  $\frac{3}{4}$  inch apart, as for lime, require  $\frac{1}{4}$  to the square foot, or 13% to the square yard, to which add  $\frac{4}{3}$  for waste, making practically 14 to the square yard. So to find the lath required increase the square feet to be lathed by  $\frac{1}{4}$ , thus: 900 square feet require 900 +  $\frac{1}{4}$  of 900, or 1350 lath plus 4% = 1404

When laid 1/4 inch apart, as for cement plasters, require 7 per cent more lath When there are no openings add 10 per cent to amount obtained by above.

#### BUILDERS' EXPERIENCE.

Any two buildings of the same style and materials and for the same purpose will cost practically the same per cubic foot, though they may differ widely in both shape and size. Therefore, it is only necessary to keep a record of the cost of buildings in any given locality to be able to figure the approximate cost of similar buildings from their cubic centents. The following figures compiled by such eminent authorities as F. E. Kidder, of Denver, Colorado, James N. Brown, of St. Louis, and Fred T. Hodgson, may be relied upon as a safe approximation to the cost of any proposed building: building: Table of Approximate Cost Per Cubic Foot.

The cubic contents from cellar floor to the "square," or in case of attle being finished to the ceiling of the highest finished room.

Depreciation, Waterest One h To arrive at the present value of any building as compared with the cost of a new one, the U.S. government uses what is known as Tiffany's Estimate, which applies to buildings on which the ordinary repairs have been kept up. For each year a building has stood, deduct from what a new one would cost, as follows:

Occupied by owner, deduct per year.

Occupied by tenant, deduct per year.

11/1011/2 2/2 to 2/4/6.

#### SIZE AND SPEED OF PULLEYS.

Mond ha

Of two pulleys connected by a belt, the one transmitting the power is the Driver, and the one receiving it the Driver. Four problems commonly

the Driver, and the one receiving it the Driven. Four problems commonstates, namely:

I. To find the diameter of the Driver. Multiply the diameter of the Driven by its revolutions; then divide this product by the revolutions of the Driver, and the result will be the diameter of the Driver.

II. To find the revolutions of the Driver: Multiply the diameter of the Driven by its revolutions; then divide this product by 'he diameter of the Driver, and the result will be the revolutions of the Driver.

III. To find the diameter of the Driven: Multiply the diameter of the Driver by its revolutions, then divide this product by the revolutions of the Driven. Multiply the diameter of the Driver by its revolutions of the Driven: Multiply the diameter of the Driver by its revolutions; then divide this product by the diameter of the Driver by its revolutions; ther divide this product by the diameter of the Driven, and the result will be the revolutions of the Driven.

1. What size Driver running 300, is required to make a 12 inch Driven go 900? By rule I.: 12 × 900 = 10800; then 10800 ÷ 300 = 36, the required diameter of Driver.

II. How fast must a 36 inch Driver revolve to make a 12 inch Driven go 900? By rule II.: 12 × 900 = 10800; then 10800 ÷ 36 = 300, the required revolutions of Driver.

EST.

III. What diameter must a Driven have to go 000 from a 30 inch Driver revolving 300? By rule III.: 36 × 300 = 10800; then 10800 + 000 = 12, the

required diameter of Driven.

IV. What speed will a 36 inch Driver going 300 give to a 12 inch Driven by rule IV.: 36 × 300 = 10300; then 10800 + 12 = 000, the revolutions of the Driven.

#### III. MASONRY.

1. FOUNDATION. To lay 1000 brick in wall...... 3.50 To lay 1000 brick in chimneys...... 7.50 To tuck point, about 3 cts. per square foot

To cement foundation walls on the outside above grade: Material-One barrel Portland cement (380 pounds or 4 cubic feet or 4 bushels) and 2 barrels of sand will make about 11 cubic feet and cover 14 square yards with a coat 1 inch thick, or 17 yards 3" thick or 27

yards 1" thick. Labor: To prepare, place, and block in imitation of

stone, about 20 cents a sq. yd. 88 cubic feet of stone make 100 cubic feet in the wall.

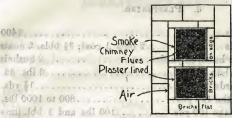

#### BRICK REQUIRED.

#### hower nd! of the pound U.S. WHITEWASH-for sheds.

The United States government uses the following whitewash on brick, stone, and wood, and it is said to be almost as good as the best paint:
Slack a half bushel of lime with boiling water, keeping it under cever while slacking; strain it and then add a peck of sait dissolved in warm water, three pounds of rice previously boiled to a thin paste, half pound Spanish whiting, a pound of clean glue dissolved in warm water, mix well and let stand for three days. Put on with brush, hot as possible. hooles and staplem

## MARK YOUR TOOLS.

Cover the iron or steel surface, on which the name is to be written, with tallow, then write the name with a scratch awl, cutting clean to the surface, then fill in the lines of the letters with nitric acid; let stand ten minutes, then clean. The name will be written on the iron or steel—etched in.

#### Labor Basis.

The basis for the cost of each labor unit is the quantity of work the average workman does in a day. This information is obtained from "time tickets" compiled by numerous contractors. It is here condensed for ready use as a guide or basis—which each contractor will vary according to his local conditions.

#### EXCAVATING.

12 Cubic Yards—Two men will shovel and wheel to a distance of about 100 yards 12 cubic yards of common clay or coarse gravel as an average in one day. Cost per cubic yard, at \$1.50 a day for labor. .......\$0.25

The cost will vary of course with the soil, the price of labor, and the machinery used.

## TO F SAME MASONRY OUT IN THE RESERVE

20 to 22 brick make a cubic foot, depending on the size.

Where there is no fire-place, one-flue chimneys of small size are often figured at 40 cents a foot and two-flue chimneys at 75 cents a foot for the labor and material.

Wages per day, \$2.50.

Buildings not over two stories above basement, balloon frame.

#### A Day's Work.

STUDDING, 2x4 to 2x6—Two men will frame and place, on
the average, 800 lineal feet a day. Cost per 1000 lineal
but feet standaron sell with and submarios eger \$6.25
RAFTERS, 2x4 to 2x8, on gable roofs—Two men will frame
and place, on the average, 600 lineal feet a day. Cost
per 1000 lineal feet
On hip roofs, including deck framing, 500 lineal feet is an
average day's work for 2 men. Cost per 1000 lineal feet, 10.00
Sheathing—Fitting and placing 1000 feet of boards or wide
shiplap is an average day's work for 1 man. Cost per
1000 feet
OH TANKS DATE OF THE STATE OF T
Vertical boards on barns, 2000 feet is an average day's work for 2 men, including battens. Cost per 1000 feet. 2.50
work for 2 men, including battens. Cost per 1000 feet. 2.50 Of 1x6 D. & M., 750 feet is a day's work 3.55
Siding: ½x6—Average day's work for 2 men 800 feet. Cost
per 1000 feet
1x4—Average day's work for 2 men 500 feet. Cost per
10.00 feet
Belt courses, per lineal foot, about
Shingles—On ordinary roofs 1 man will carry up and place
2000 as general average per day. A day's work varies
from 1500 to 2400. Cost per 1000 shingles 1.25
Exposed 41 inches figure 8 shingles to the square foot.
CORNICE—Plain, consisting of fascia, planceer, and frieze.
An average day's work for 2 men is 70 lineal feet. Cost
per lineal foot
With plain brackets, crown and bed molding, a day's work
for 2 men is 50 lineal feet. Cost per lineal foot
Of panel mold, 2 men will prepare and place an average
of 300 feet a day, or 400 feet of 12-inch stuff. Cost, re-
spectively, per 100 lineal feet
Running quarter rounds, coves, etc., per 100 lineal feet 40
Of 2-inch crown, a day's work for 2 men is 800 feet;
of 5-inch, 350 feet. Cost per 100 lineal feet, respect-
ively\$0.622 and 1.48
Gutters, 2 to 4 cents a lineal foot.
ively
cts. The foregoing are basing prices for ordinary work. Many
The foregoing are basing prices for ordinary work. Many
cornices cost much more, but few less.
FLOORS: 1x6—One man will lay an average of 625 feet a day.
Cost per 1000 feet
1000 feet
At above rates the floor is well jointed and blind nailed
to every joist. With less care 900 to 1000 feet of 1x6
can be laid in a day.

BASE-6 to 12 inches, consisting of but 1 member molded or
plain, using base angle block to avoid coping, 1 man
will place an average of 250 feet lineal a day. Cost
per lineal foot\$0.01
If necessary to smooth add per lineal foot
For coping add 15 cents for each angle, 1 member.
For base of more than 1 member add for each per foot, .01
WAINSCOTING Fitting and placing paneled wainscoting
that is in sections ready made, per square \$1.75 to 2.00
Shelving, 1x12—One man will prepare and place an aver-
age of 80 feet lineal a day. Cost per lineal foot03
HOOK STRIPS, 1x3 or 4—One man will place an average of
100 feet lineal and put on the hooks. Cost per lineal
foot
CLOSET DRAWERS—An average set of 4 drawers, not dove-
tailed, completed and placed in closet is a day's work, 2.50
PAINT AND VARNISH WORK.
LABOR: One man will prime and knot 100 square yards in
a day. Cost per square yard
In 2d or 3d coat work 75 yards is a day's work. Cost per
square yard per coat
LABOR AND MATERIAL:
As usually figured, outside work, including material, per
yard per coat
As usually figured, inside varnishing (oil finish) 12
Outside door and casing estimated at 4 to 5 yards on inside.
Inside door and casing estimated at 8 to 10 yards in the two sides.
Windows on inside estimated from 3 square yards up.
Base estimated at 12 inches wide or over.
Estimate porch and bracket work double.
MATERIAL TO THE 100 SQUARE YARDS:
Priming, 20 pounds white lead and 4 gallons linseed oil.
2-coat work, 40 pounds white lead and 8 gallons linseed oil.
50 pounds white lead and 12 gallons linseed oil.
3-coat work $\begin{cases} \frac{1}{2} \text{ pint shellac for knotting.} \\ 1 \text{ pound putty.} \end{cases}$
{ 3 to 4 pounds of color pigment.
Or 3-coat work, 4½ gallons mixed paint.
To MEASURE: Use tape, beginning at top or bottom, bend line

To Measure: Use tape, beginning at top or bottom, bend line into all recesses, making it touch every part of siding or wall that will receive paint; multiply the height so obtained by the length obtained in the same manner; or what is easier, find the surface without depressing line and add \(\frac{1}{8}\). The total square feet divided by 18 will give the number of pounds of lead required for three coats; or divided by 200 the gallons of mixed paint required for 3-coat work.

#### Another Basis.

To obtain the cost of the labor many estimators use the following schedule: A second and GAP to be asked as again at a seal of the Framing and Placing dimension, per 1000 feet B. M......\$7.00 SHEATHING-Sides, per square (measured on the building in each case)..... .30 .35 Drop, 1x6, per square. .85 .50 SHINGLES—Per square..... 1.00 FLOORS—1x6, per square......\$0.25 to .50 .60 Overhead, per square..... Wainscoting, per square.....\$1.75 to 2.25 OPENINGS—To put up jambs, hang, and case a door, 2 sides 1.50
To hang and trim a door ... \$0.50 to .75
To hang, fit, and trim sash ... \$0.50 to .75
To case window, fit stool and apron ... 1.00 To hang inside blinds, per pair.....\$0.75 to 1.00 Calsomining, material included, per square......\$0.60 to .75

#### How to Make Blue Prints.

The paper, which may be bought ready for use, should be stored in a dry place and be entirely shielded from the sunlight until used.

1. Provide a smooth board as large as the tracing to be copied. 2. Lay on this two or three thicknesses of common blanket to give a slightly yielding backing for the paper.

3. Lay on the blanket the prepared paper with the sensitive

4. Lay on the paper the tracing, smoothing it out as perfectly as possible to insure perfect contact with the paper.

5. Lay on the tracing a piece of clear plate glass, which should

be heavy enough to press the tracing close down upon the paper.

6. Expose the whole to a clear sunlight from six to ten minutes. If a clear sky can be had, the exposure must be continued from thirty to forty-five minutes, and under a cloudy sky sixty to ninety

7. Remove the prepared paper and drench it in clear water,

and hang it up by one corner to dry.

The paper is of a full yellow or bronze color. After the exposure to the light the surface becomes a darker bronze and the lines of the tracing appear still darker on the surface. Upon washing the paper the characteristic blue tints appear with the white lines of the tracing in vivid contrast.

#### STRENGTH OF JOISTS.

The table herewith has been carefully calculated by this formula:

Safe load = 2 x thickness x square of width x A

Span in feet

in which the value of A is 1-18 of the fiber strain or modulus of rupture for safe loads. It is the formula used in modern construction by F. E. Kidder and other noted civil engineers.

#### ITS USE.

What size joists are required in a hay bay 20 feet wide, 40 feet long and 12 feet high, the joists being supported at the ends only? The cubic contents = 20 x 40 x 12 cr9600 cubic feet. At 512 cubic feet to the ton this bay will hold 18¼ tons or 37500 pounds. Supposing the joists to be set 24" on centers there would be 21 joists and each would have to carry 1-21 of 37500 pounds, Referring to the table the safe load for 1 x 10 20 is 1000 pounds. This multiplied by 1¾, "the exact thickness of the joists = 1750 pounds, whereas provision must be made for 1750 pounds; therefore 3 x 10's must be used or the 2 x 10's must be set closer than 2 feet on centers.

#### ECONOMY.

It also indicates the economical sizes to give best results. For example, the safe load for a  $4 \times 4$  16 is 800 pounds  $(4 \times 200)$  while the safe load for a  $2 \times 6$  is 900 pounds  $(2 \times 450)$ , showing that while the  $2 \times 6$  contains much less material, yet when used on edge it is 1/8 stronger than the 4 x 4.

Safe Quiescent Loads Uniformly Di Yellow Pine Distributed for Long Leaf

set on edge and supported at both ends. Multiply weight given by exact thickness of joists used.

			337	426	38	526	757	1031	1184	1347
			320	405	40	500	720	980	1125	1280

137 The safe loads above estimated are for clear pieces and full sizes. On account of scant sizes and more or less defective stock, an allowance of 20 per cent must be made. For example, the afe load for a 1x8-3 is 1600 pounds, and for a 2x8-8 two times this or 2200 pounds. But or reasons stated 20 per cent must be deducted, reducing the safe load of a 2x8-8 to 2560 pounds.

The safe load for fir is 90 per cent of above long leaf yellow pine; for white oak 75 per cent; for short leaf yellow pine and Norway pine 70 per cent; hemlock 65 per cent; white pine 60 per cent; spruce 70 per cent; cast iron 222 per cent; wrought iron 666 per cent, and medium steel 888 per cent.

- I. When the load is concentrated midway between the supports, take only half of above loads.
- For beams fixed at one end the other unsupported and the load uniformly distributed take one-fourth of above loads; if the load is concentrated on the unsupported end, then take only one-eighth of above.
- III. In the above, the safe load includes the weight of the joists, which must be deducted to get the net or superimposed safe load.
- IV. Joists longer than 12 times their width used without intermediate supports are apt to crack plastered ceilings.
